Problem

In some cases, when using the PATCH utility to modify a byte, an erroneous 'String Not Found – Abort' would be returned, even when a LIST of the file would confirm the presence of the byte to be patched at the address specified. This was caused by an invalid compare when the target byte was at the beginning of a sector.

To observe the problem, attempt the following patch:

```
PATCH PATCH A=2989  F=7E  C=7E
```
(The '7E' byte is the first byte in the second sector of PATCH.)

Solution

The following patch is for TRSDOS 2.0 and 2.0a only and will correct the symptom described above.

```
PATCH PATCH A=3263 F=B79932A5323AA432321933CD C=9132A5323AA432321933B7C4
```
